Treatment Plan and Fee Quote

Patient Name

Treatment Description:

**Phase I:**

Remove lower front 5 teeth (#’s 21, 22, 24, 25, 27). Prepare remaining lower teeth for crowns. Place long term temporary crowns / bridge (#’s 18 – 31).

Remove upper front 4 teeth (#’s 6, 8, 9, 10). Prepare remaining upper teeth for crowns. Place long term temporary crowns / bridge (#’s 4 – 15).

**Phase II:**

After placement (and healing) of implants by Dr. G*******, we will place final restorations on natural teeth and implants in upper and lower arches.

<td>Follow-up and adjustments as needed</td>
</tr>
</tbody>
</table>

***Dr. G****** will follow up and let me know when the implants are ready for permanent restoration. Phase II treatment may change depending on outcome of implant treatment and response of natural teeth.
As per our discussion, other treatment options include:

- Orthodontic / orthognathic treatment. I have strongly recommended this as the best approach.
- Restorative treatment of existing natural teeth.
- Referral to a specialist in reconstructions (Prosthodontist).
- No treatment.

Concerns and challenges

Our goal is to restore your smile with the following in mind:

- Reduce your gummy smile (chief complaint) and reposition your front teeth. We will reduce the amount of gum you show in your smile, but the only way to create an ideal display of gums and teeth and ideal bite is with orthognathic surgery and orthodontics as previously discussed. As an alternative we will extract the front teeth that have migrated downward (on the upper) and upward (on the lower). This involves removing natural teeth that would normally be kept.
- Your remaining teeth have been restored extensively with silver fillings. And, your bite has collapsed. Our plan includes restoring these teeth with crowns to protect them and balance your bite as much as possible. Again, orthodontic / orthognathic treatment will achieve a more balanced bite.
- Teeth that have been restored extensively may require root canal during or after treatment. This can’t always be predictable. This may require referral to an endodontist (root canal specialist) at additional cost.
- You will be in temporary restorations for an extended period of time while your gums and implants heal. This will give us an opportunity to fine-tune the esthetics and accommodate your new bite. The temporaries may require maintenance during the implant healing phase.
- Implants are successful the vast majority of the time. However, they can fail. Depending on the success of all the implants, our treatment plan may need to change. Also, during the implant surgery, the number or location of implants may change and affect the final restorative approach.
- You have a history of TMJ clicking and locking. This full mouth restoration will not change or improve that condition. A night guard is recommended after your restoration is complete.

As with any dental treatment, there may be unforeseen complications. We will make an effort to anticipate any changes in the treatment plan and advise you at that time. Likewise, the timing or spacing of appointments may need to be modified as needed to accomplish the best result possible.
While dental treatment such as this may last for many years, we cannot make any guarantees as it pertains to longevity. It is possible you will need further treatment or retreatment in the future.

**Continuing professional preventive care and meticulous home care will be critical to maintaining your dental restorations for as long as possible.** I recommend getting your teeth cleaned at least every 3 - 4 months.

Fee to complete treatment as described above:

**Phase I:** $11,000

**Phase II:** $48,645 (may change depending on the results of implant surgery)

These fees do not include the periodontist’s fee for implant placement or related services provided by him.

Payment options include:

1. Full payment with cash or check.
2. Credit card.
3. Financing available through “Care Credit.”
